

AEL — The Build Plan

1. Phases, each ending in something that works

- **Phase 1: Ingestion & Translation.** At the end of this phase, a person can put in a raw Dutch text and get a clean English translation. We build this first because all the next steps need clean English data.
- **Phase 2: Appraisal & Drafting.** At the end of this phase, a person can take the clean English text and make the AI write the final handbook page. This phase needs Phase 1 to be completely finished first.

2. Subtasks inside each phase

- **Subtask 1.1: Local Cleaning Script.**
 - Role: Developer (David)
 - Touches: the local input folder (Blueprint part: Ingestion)
- **Subtask 1.2: Translation Prompt.**
 - Role: Developer
 - Touches: `translation_prompt.txt` (Blueprint part: Translation)

3. A test gate

- **Test Gate for 1.1 (Cleaning):** The tester puts in a text saying "Jan Jansen bought shirts for €45.50 for FC Twente" and runs the script. The test passes only if the output document does not have the words "Jan Jansen", "€45.50", or "FC Twente".
- **Test Gate for 1.2 (Translation):** The tester puts in a Dutch text and runs the AI. The test passes only if the output is in English and the reading level is B1/B2.

4. A commit gate

Nothing is committed until its tests pass.

- **Rule:** The developer cannot use `git commit` until the tester says "Pass" on the test gate. If the test fails, the developer must fix the code, and the tester must do the test again from the start.

5. A push gate

The next phase starts only after a successful merge and push.

- **Rule:** When all tasks in Phase 1 pass the tests and are committed, the developer uses `git push` and makes a Pull Request to the main branch. The tester checks it and

does the Merge. If the merge fails, we cannot start Phase 2 until the developer fixes the merge conflict.

6. Boxes, and what happened beside them

(The tester ticks these boxes immediately after testing)

- [] **Subtask 1.1 Test:** (Date) - (Commit or PR) - (Result: Fail - it leaked the name Jan Jansen)
- [] **Subtask 1.1 Re-Test:** (Date) - (Commit or PR) - (Result: Pass - private data was successfully hidden)
- [] **Subtask 1.1 Commit Gate:** (Date) - Gate opened, code was committed.

7. The rules, written out

(Instructions for someone new to follow without asking)

1. **Run:** As a tester, always download the newest script from the developer, open the terminal, and put in our test text with names and prices.
2. **Commit:** We only commit the code when the terminal gives tester a clean text with no private data. If the gate does not open (the script fails), the developer can try to fix it as many times as they want, but we never commit bad code.
3. **Push:** We only push to the main branch after the whole weekly task is tested and approved.
