AEL — The First Evaluation & Decision Log (Team 6)

1. The Decision Log (Choices since Week 3)

- **Decision 1: Simple Local Folders (Week 3)**
    - **What we chose:** We decided to store our text files and scripts in a simple local folder structure instead of setting up a database.
    - **What failed/changed:** Nothing failed here. We kept it because it is much easier for our non-technical team members to open files directly on their laptops.
- **Decision 2: Local Anonymization Script & Commit Gate (Week 4)**
    - **What we chose:** We built a local Python script to automatically remove private data before our LLM reads the text.
    - **What failed:** During the first tests, the script failed and leaked the test name "Jan Jansen" and private prices.
    - **What we changed:** We fixed the code and now it works
- **Decision 3: Adopting the LLM Wiki Template (Week 5)**
    - **What we chose:** We decided to change our storage architecture to the wiki LLM adopting the template
    - **What we learned:** We found that this architecture is necessary for our evaluation. Our original simple folders had no automated way to track lookups, and it was hard to verify if the AI hallucinated a quote.
    - **What we changed:** Clone the template repo, create the three layers (raw/, wiki/, and AGENTS.md) and revise our Knowledge Architecture.

2. The First Evaluation (Testing against PRD Promises)

- **PRD Promise 1: B1/B2 English Translation**
    - **Assessment: Pass.** By putting our rules into AGENTS.md, the tool successfully turns raw Dutch articles into simple B1/B2 English without dense academic jargon.
- **PRD Promise 2: Data Privacy**
    - **Assessment: Pass.** We stuck to the strict rule of the wiki: raw interview material never goes into the raw/ wiki folder at all. The wiki only has public

reports that have been published. Field notes are kept fully offline on our laptops until scrubbed

- **PRD Promise 3: Markdown Formatting (Action Sheets & KPIs)**
    - **Assessment: Partial automation.** The wiki is good for pulling out the facts and for answering questions (with citations), but it doesn't yet automatically format the final visual handbook page with the 1-page Action Sheet.
    - **What we changed:** We are now using our PRD manual fallback. We take the verified answers from the wiki and manually format them into our final markdown template.

3. Knowledge Architecture Criteria

Our system does the two required verifications automatically, because we used the LLM wiki template:

1. A log for each lookup When we run a Query, the assistant answers using only the wiki/pages and automatically writes down every page it read in the wiki/log.md file. It records the question, the pages read and the particular passages used.

2. Confirm that a quoted passage is actually in the source. We use the Lint health check for this. We execute python3 tools/lint.py. This program will automatically check every quote on our wiki pages against the original text file in the raw/ folder to ensure that the AI didn't make up a fake quote.
